INTRODUCTION

The **EventForce Management System** is a Salesforce-based application designed to simplify and manage event planning and operations. It provides a centralized platform to organize event details, manage clients, allocate venues, coordinate vendors, and collect customer feedback. The system aims to improve efficiency, reduce manual work, and maintain accurate event-related information.

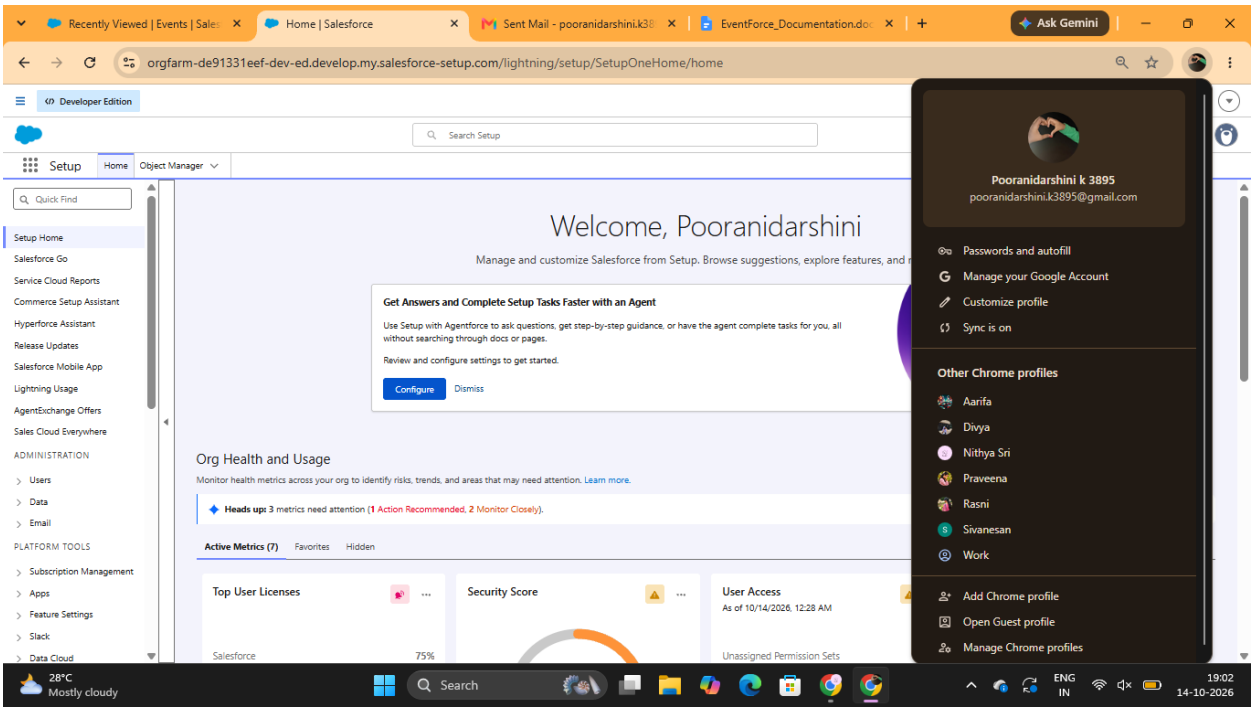

This project is developed using Salesforce features such as custom objects, fields, relationships, validation rules, approval processes, flows, Apex classes, and triggers. Reports and dashboards are used to monitor event activities and provide a clear overview of operations. Profiles, roles, permission sets, and sharing settings help manage user access and protect organizational data.

The system also includes automation to support event-related processes, such as venue availability updates, prevention of double booking, and client reminders. By integrating these features, the EventForce Management System provides an organized and reliable solution for managing event operations within the Salesforce platform.

Phase 1 – Requirement Analysis & Planning

Milestone 1 – Salesforce Account

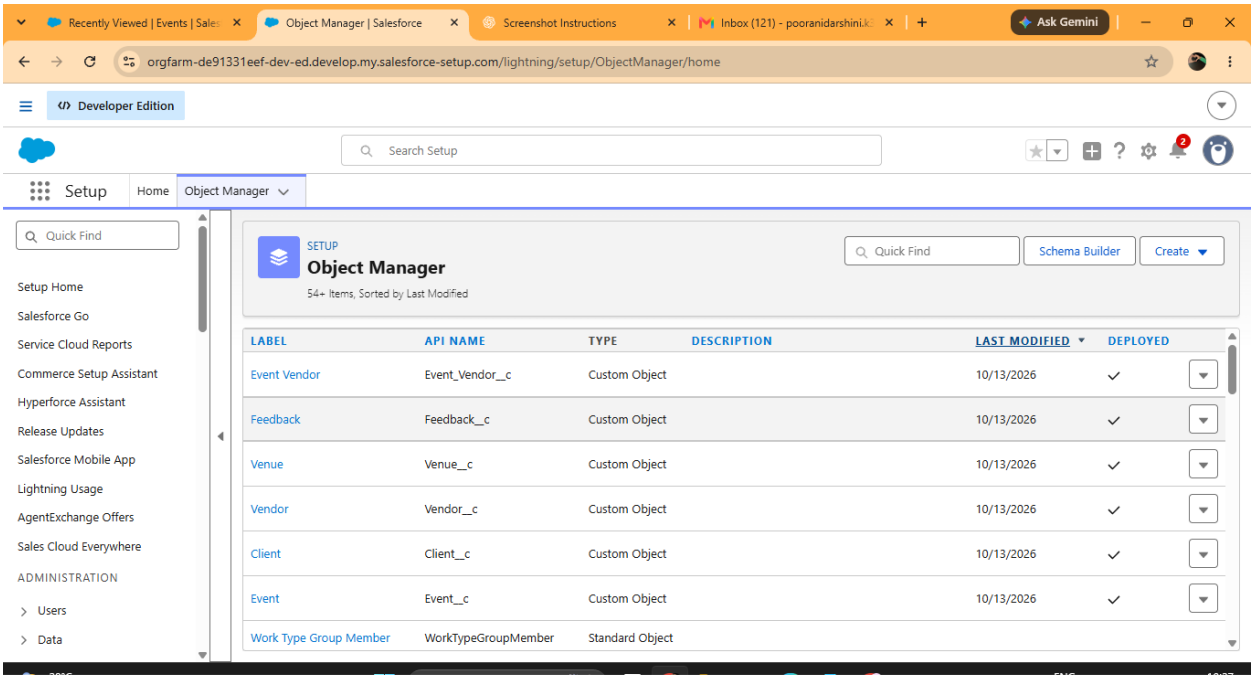

Successful login to the Salesforce Developer Account.

Milestone 2: Custom Objects Creation

Custom objects were created to store and manage event-related information. The Event, Client, Vendor, Venue, and Feedback objects organize the core business data. The EventVendor junction object connects Events and Vendors.

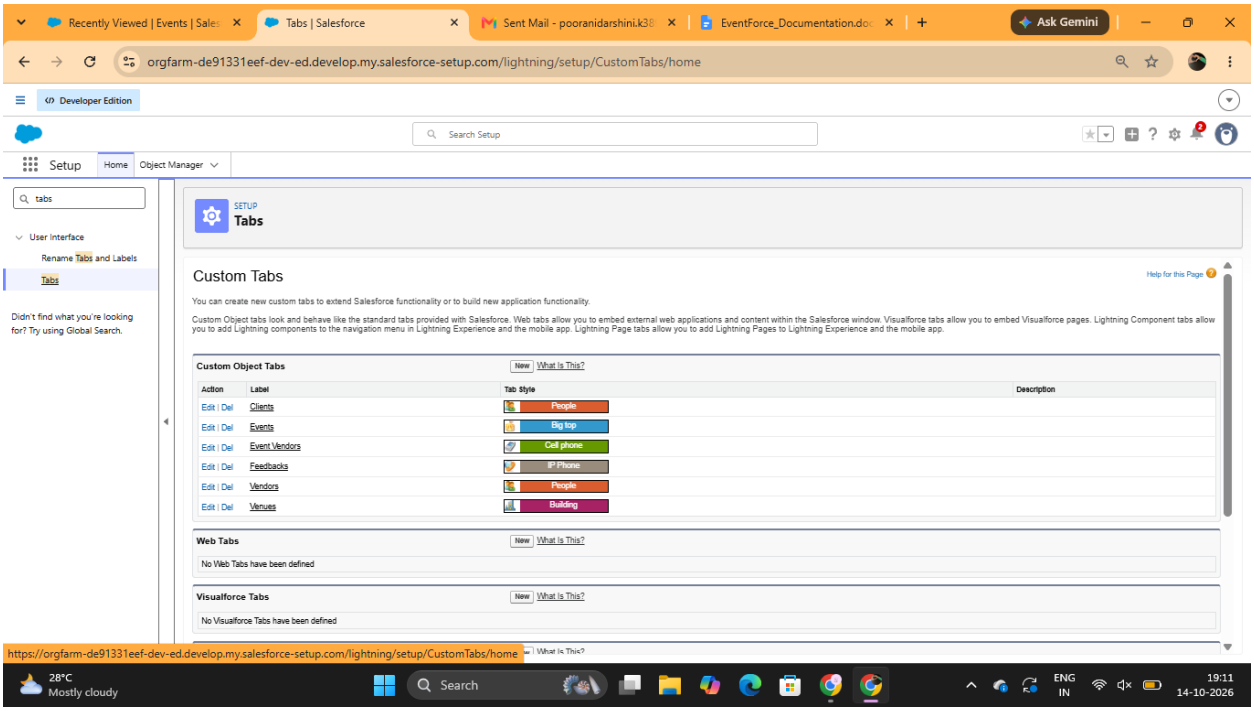

Custom Objects in Salesforce Object Manager.

Milestone 3: Custom Tabs

Custom tabs were configured to provide easy navigation to the main modules of the EventForce Management System. They allow users to access event, client, vendor, venue, and feedback records from the Salesforce interface.

Custom Object Tabs in the EventForce Application.

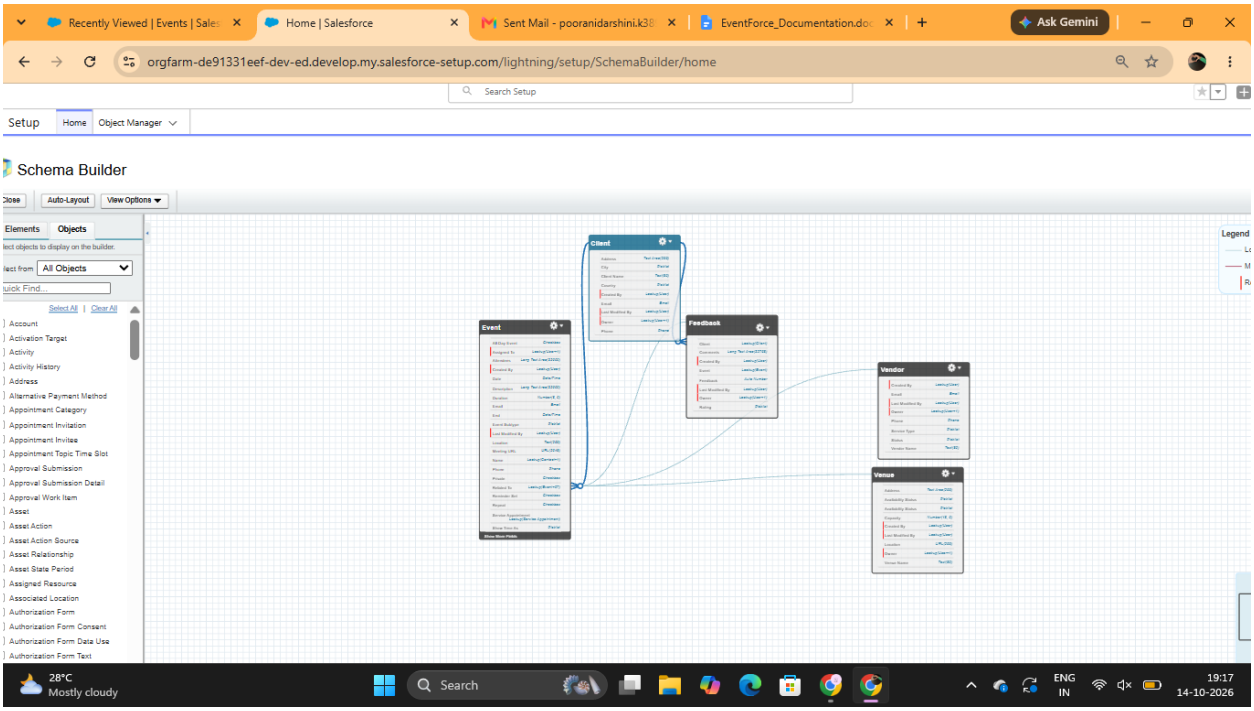

Phase 2 – Backend Development & Configurations

Milestone 4: Fields and Relationships

Custom fields were configured to store event dates, types, statuses, budgets, client details, vendor information, venue details, and feedback. Lookup and Master-Detail relationships connect the objects and maintain data relationships across the application.

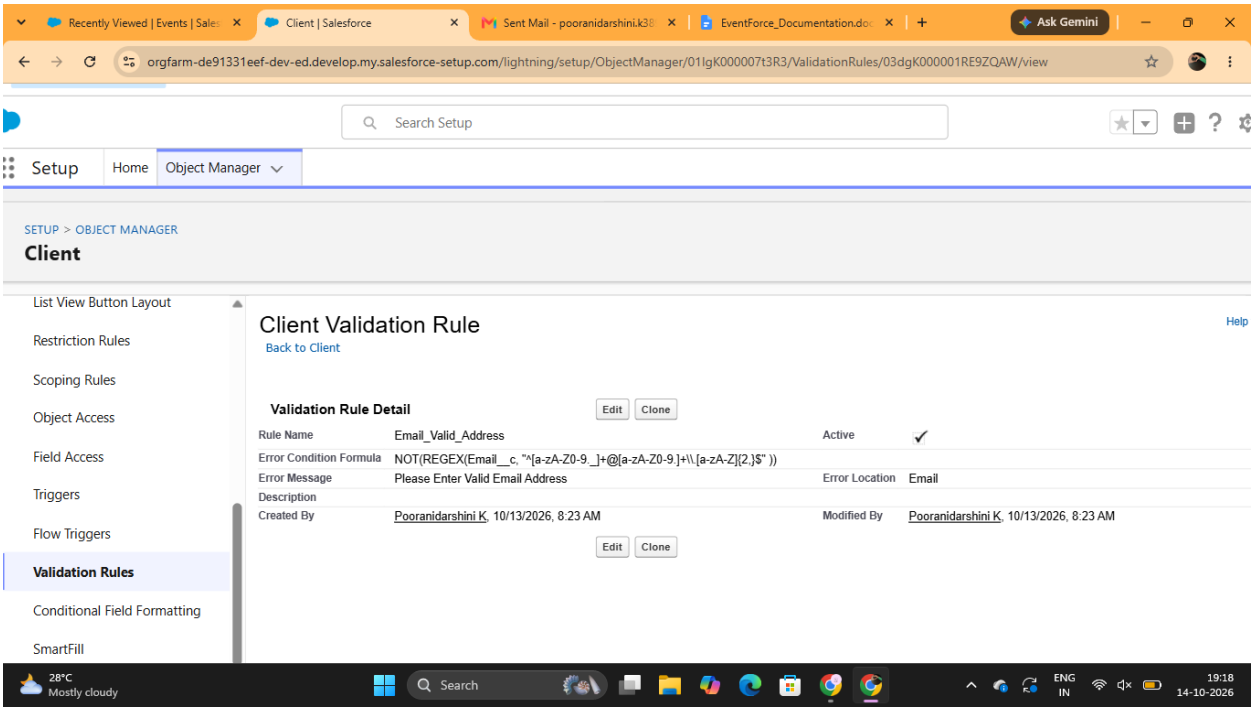

Salesforce Schema Builder Showing Objects and Relationships

Milestone 5: Validation Rules

A validation rule was configured on the Client object to check the email address format. This helps prevent invalid email information from being stored in the system.

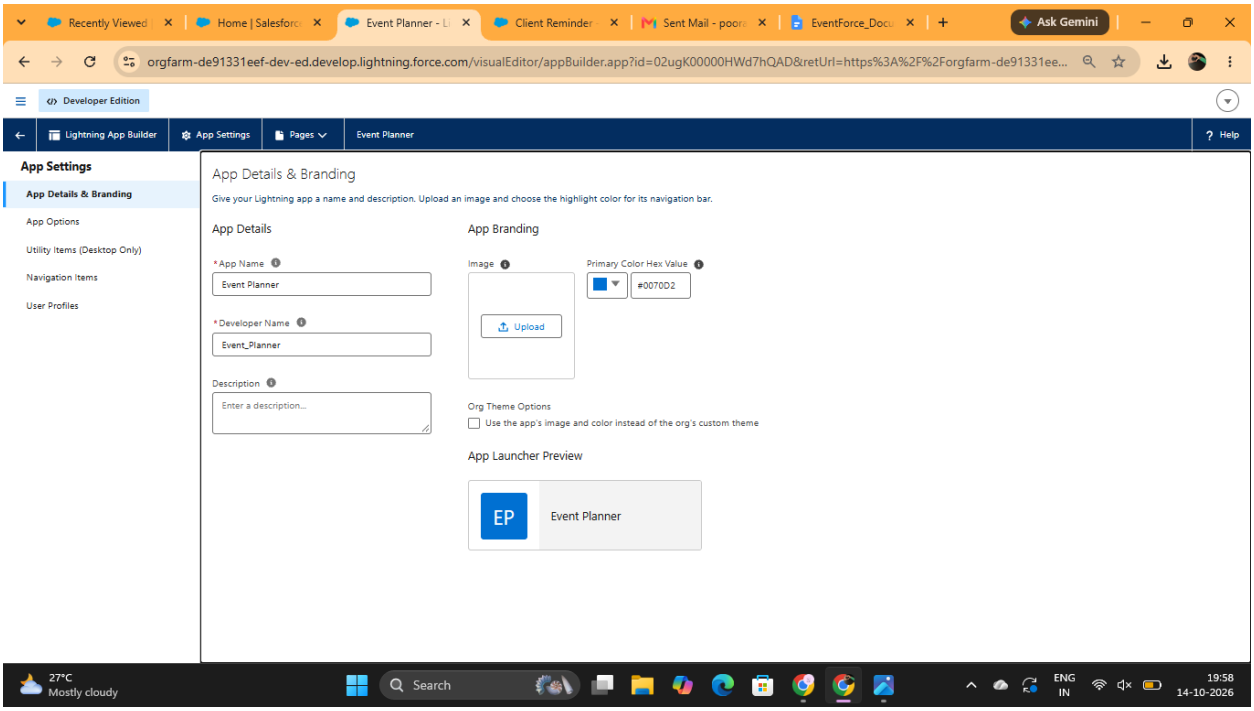

Client Email Validation Rule Configuration.

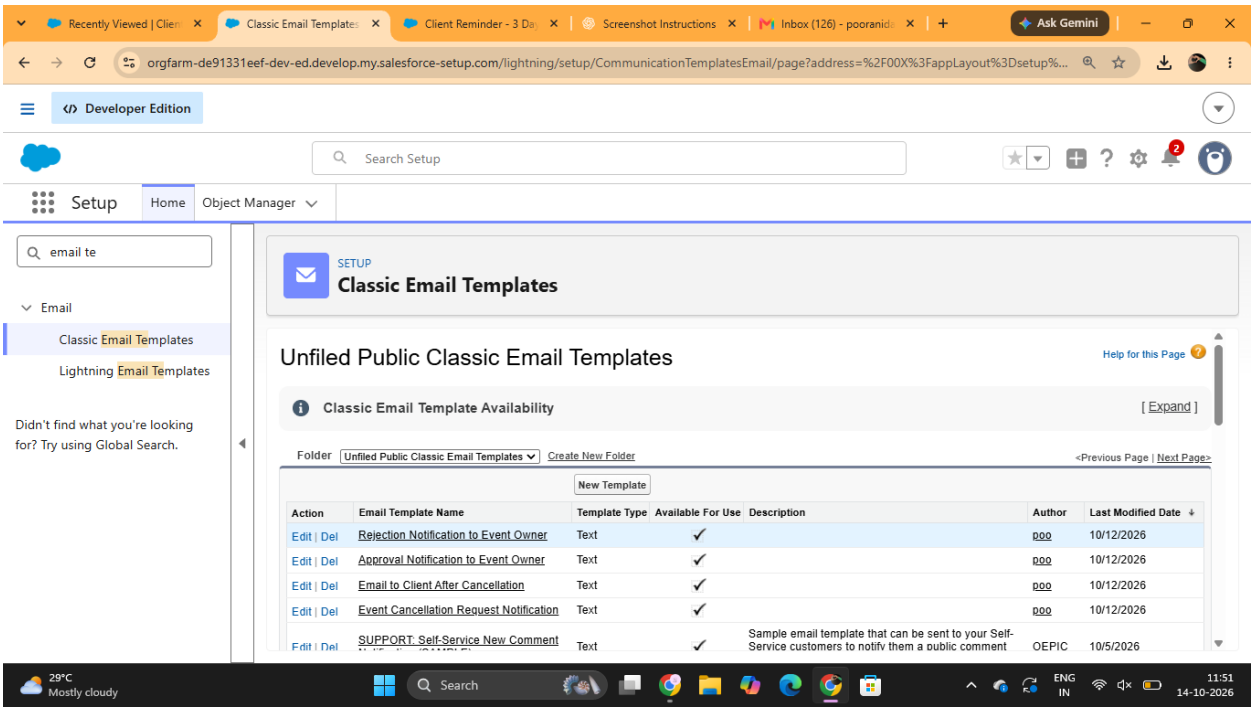

Milestone 6: Event Cancellation Approval Process

An approval process was configured to manage event cancellation requests. The process uses entry criteria and approval steps to support a controlled review workflow for cancellation requests.

Event Cancellation Approval Process Configuration.

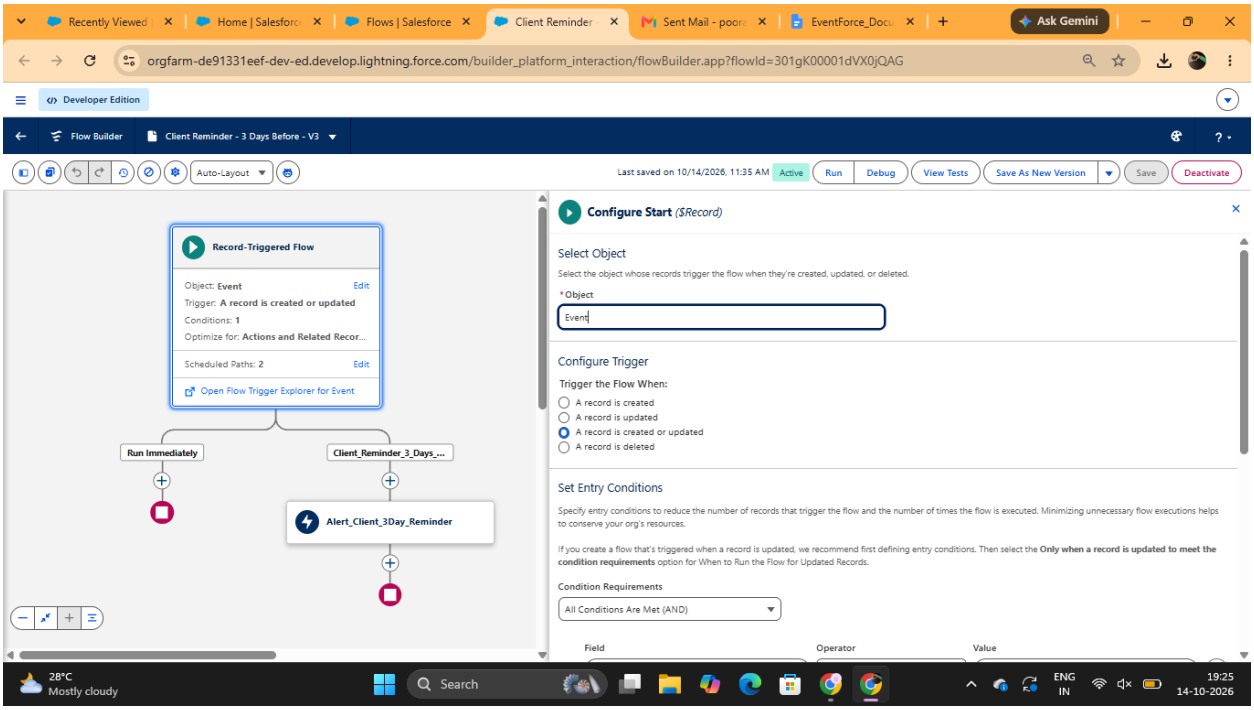

Milestone 7: Client Reminder Flow

A Salesforce Flow was configured to support automated client reminders three days before the scheduled event date. The Flow uses event conditions, a scheduled path, and an email action to automate reminder processing.

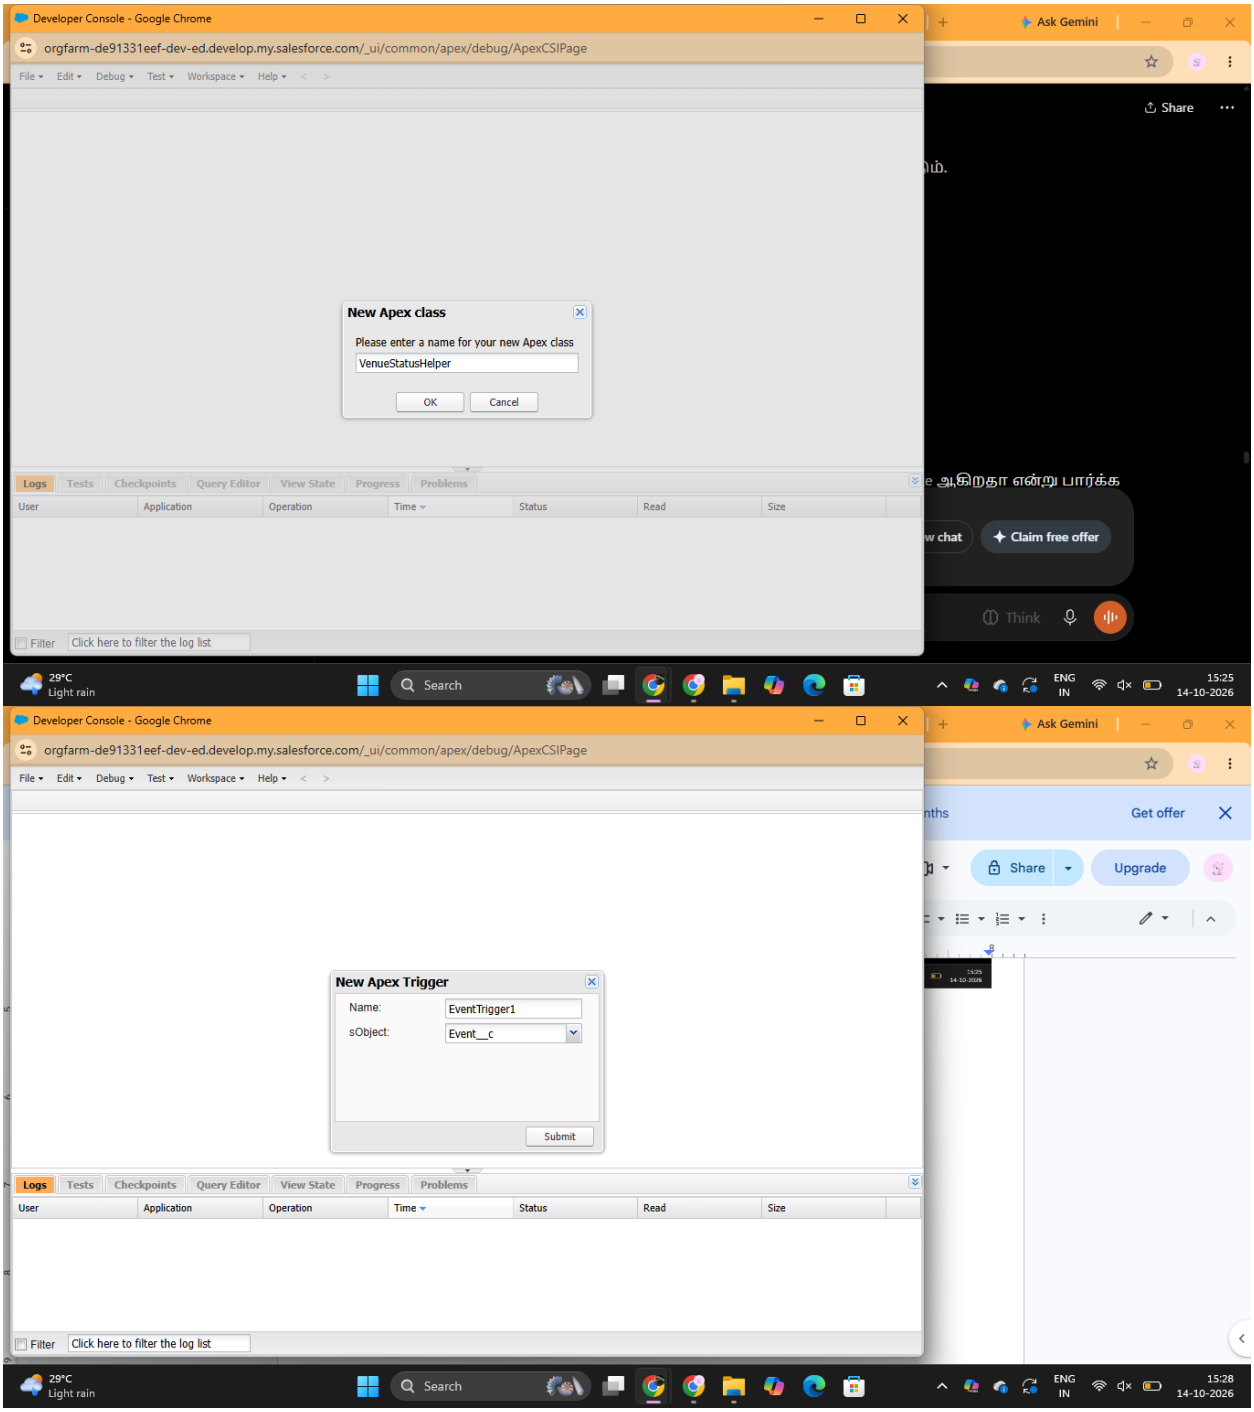

Three-Day Client Reminder Flow in Salesforce Flow Builder.

Milestone 8: Venue Status Automation

An Apex helper class and trigger were developed to manage venue availability based on event status. This automation is intended to update the related venue when an event is confirmed or cancelled.

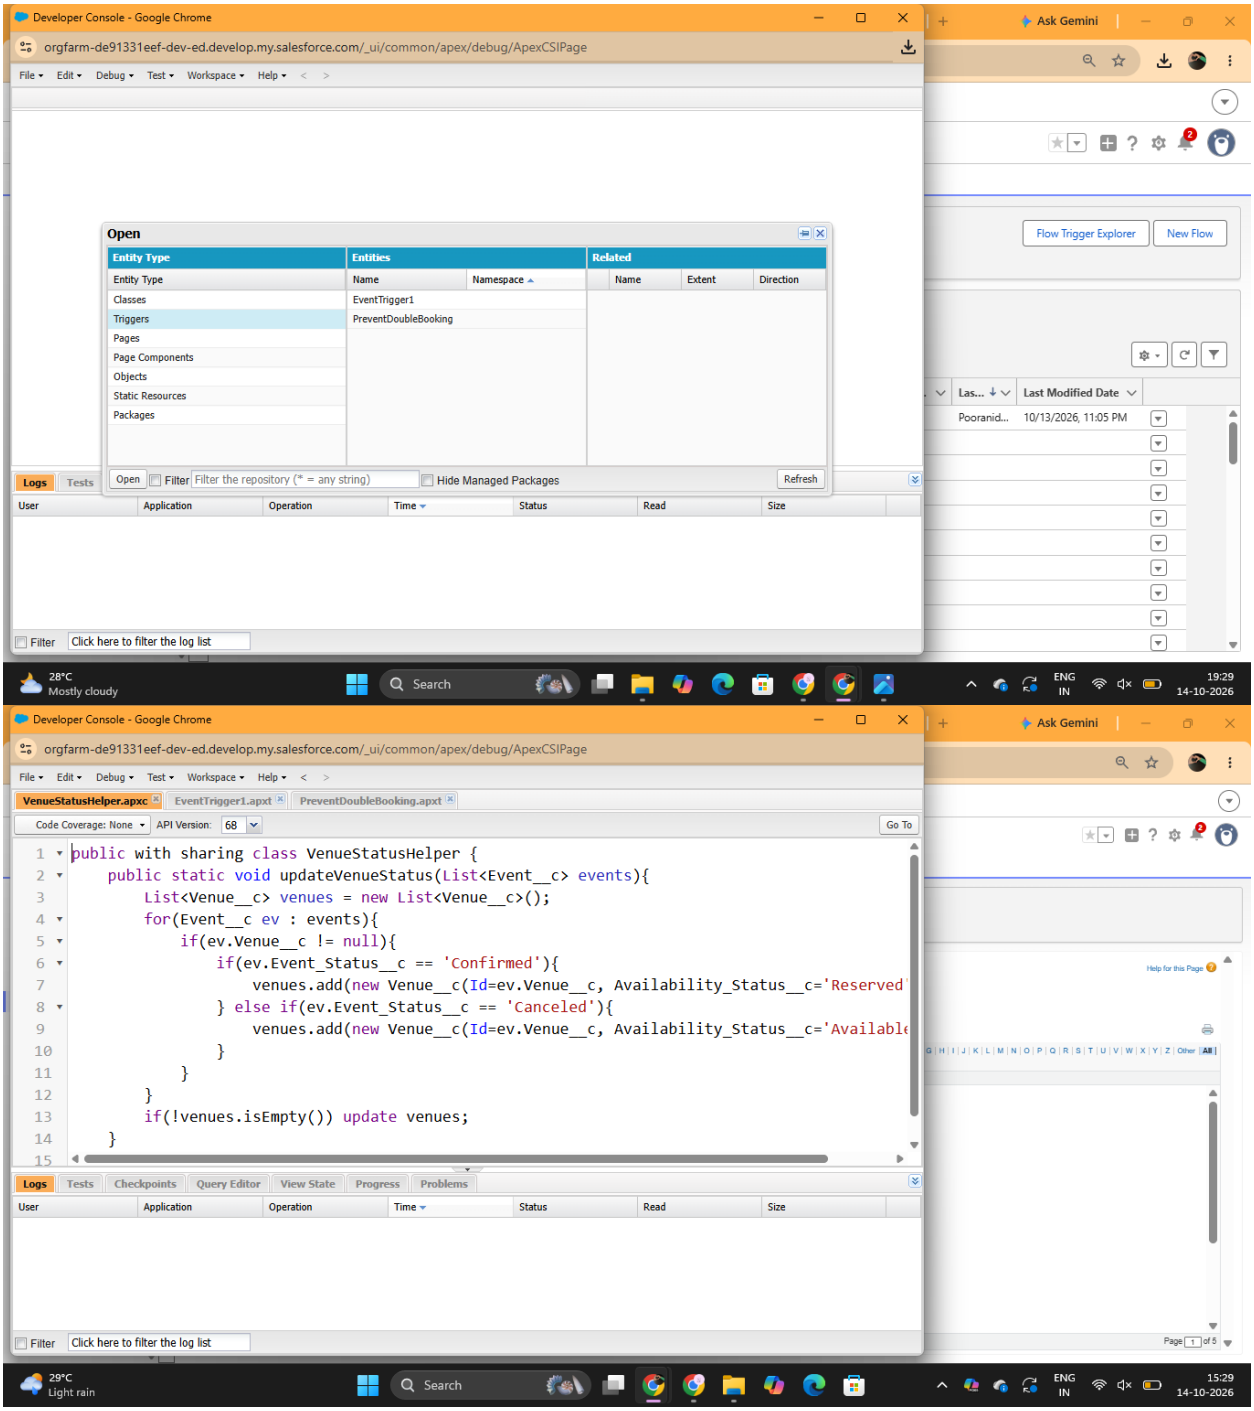

Venue Status Helper Class and Event Trigger Implementation

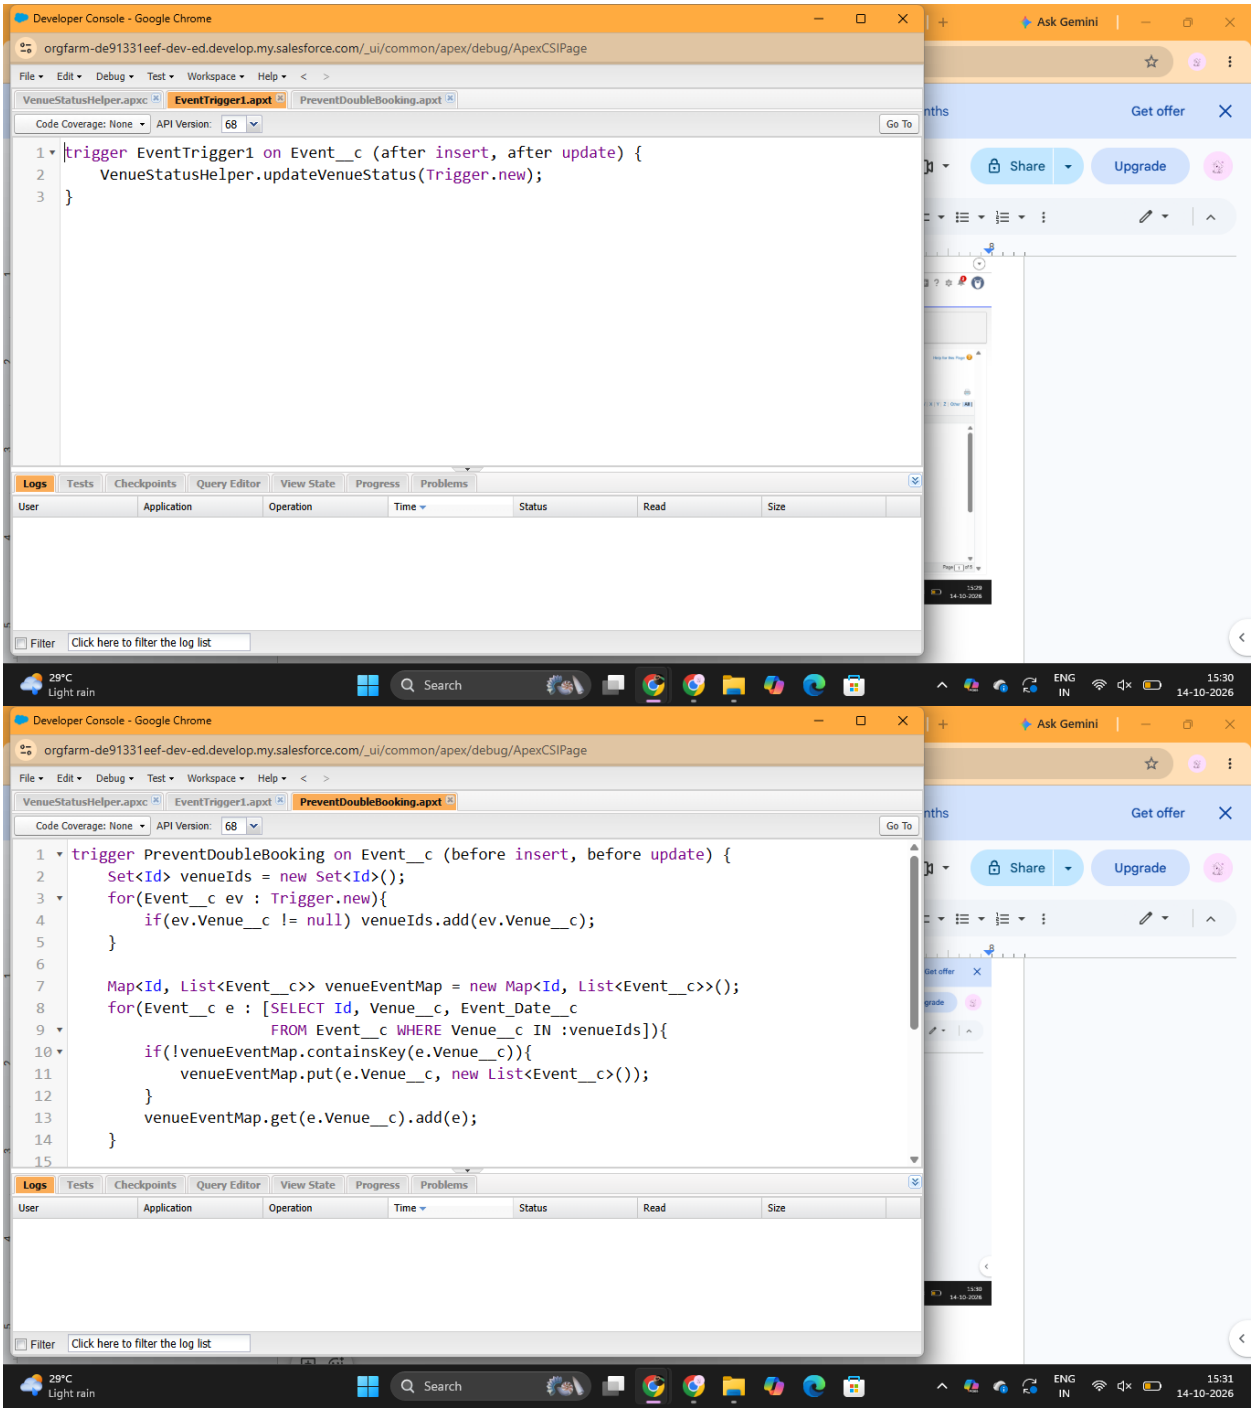

Milestone 9: Prevent Double Booking

An Apex trigger was developed to check for conflicting event bookings at the same venue and on the same date. It prevents duplicate bookings by displaying an error when a conflict is detected.

Duplicate Venue Booking Prevention

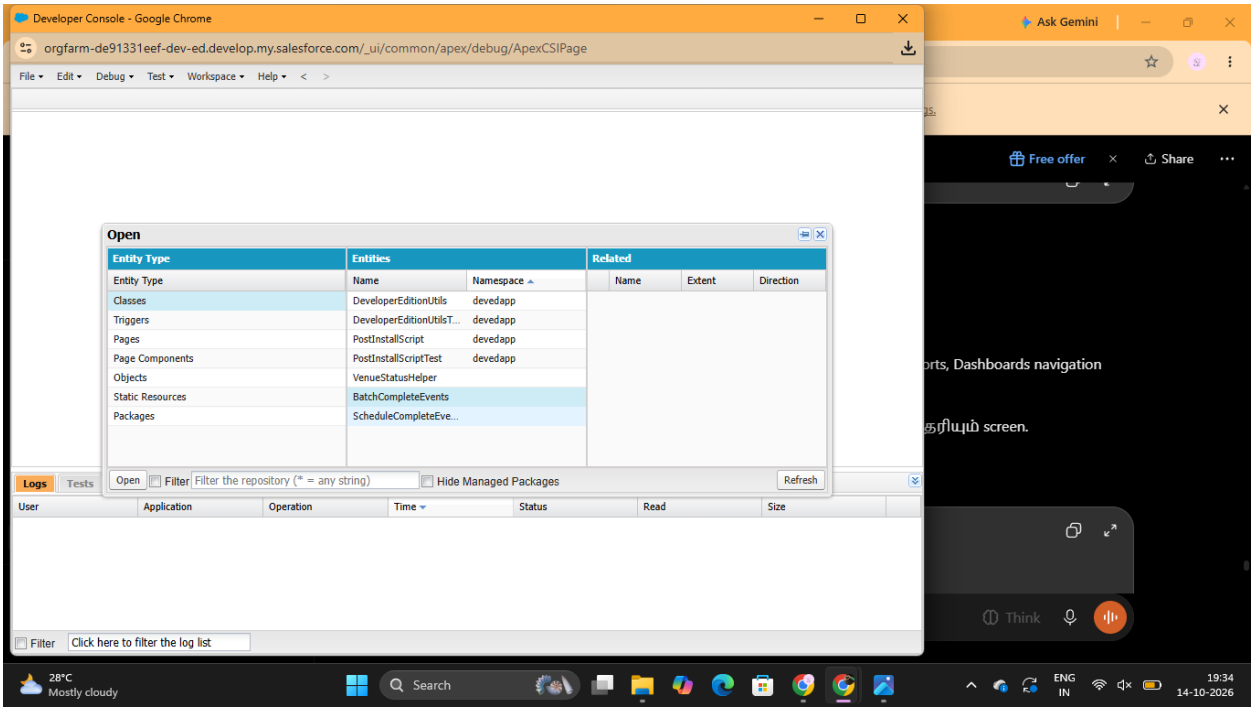

Milestone 10: Batchable and Schedulable Apex

Batch Apex and Schedulable Apex were implemented to process past events and update their status to Completed. Scheduling allows the batch operation to run automatically according to the configured schedule.

Scheduled Apex Job for Event Completion

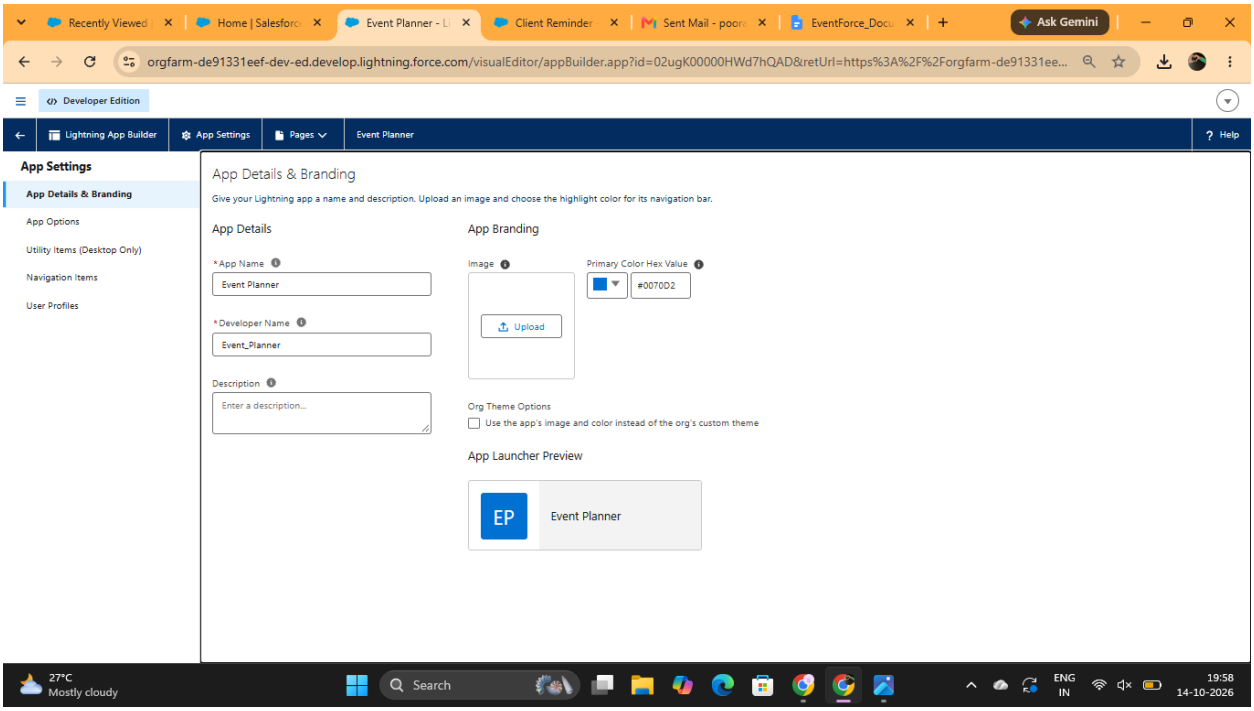

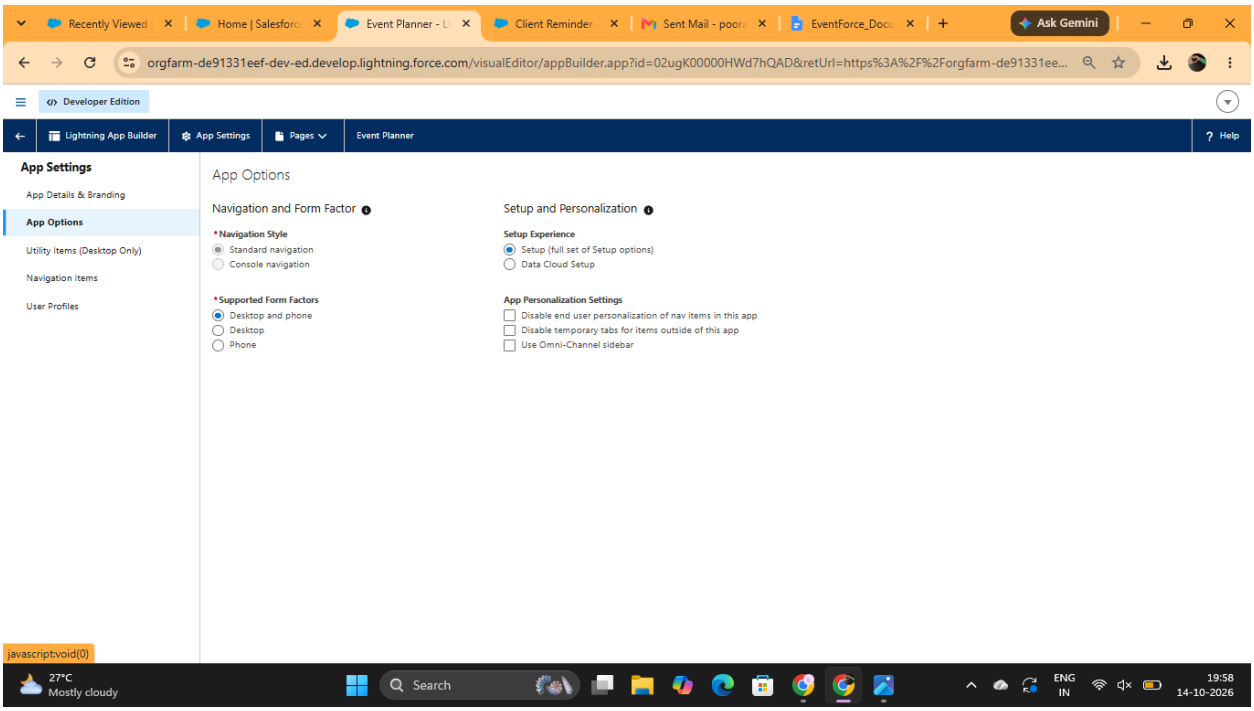

Phase 3 – UI/UX Development & Customization

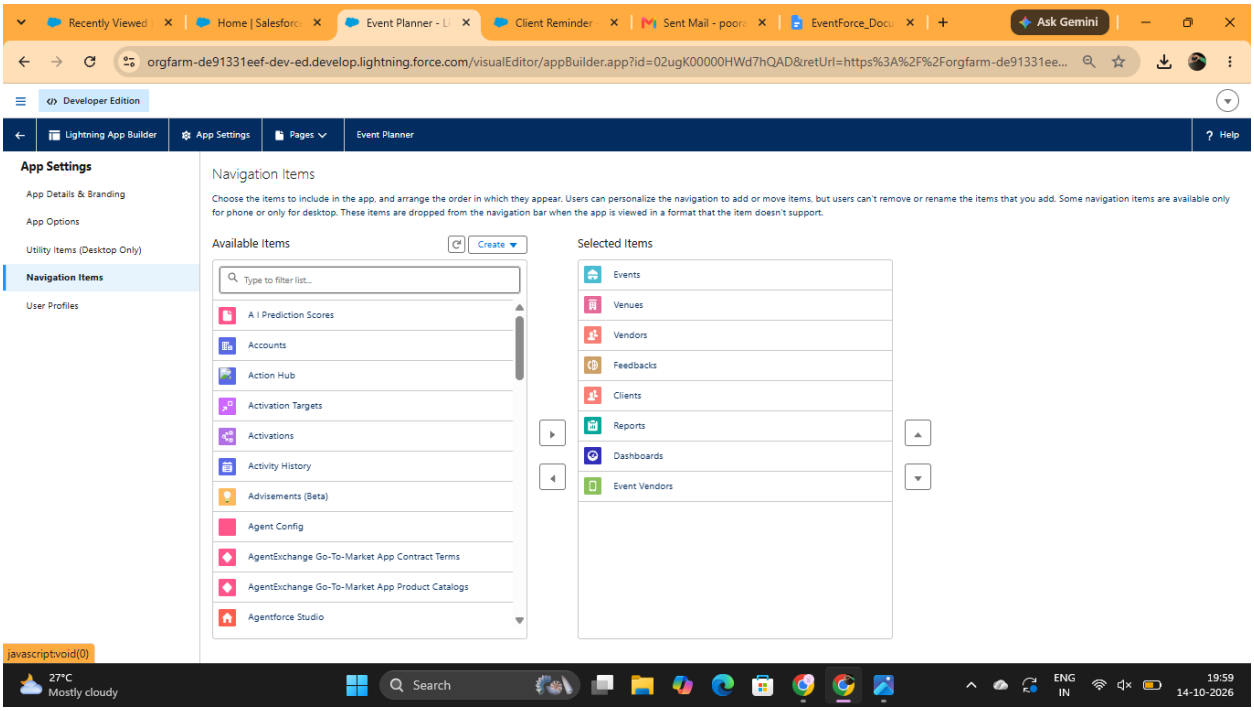

Milestone 11: Lightning App Development

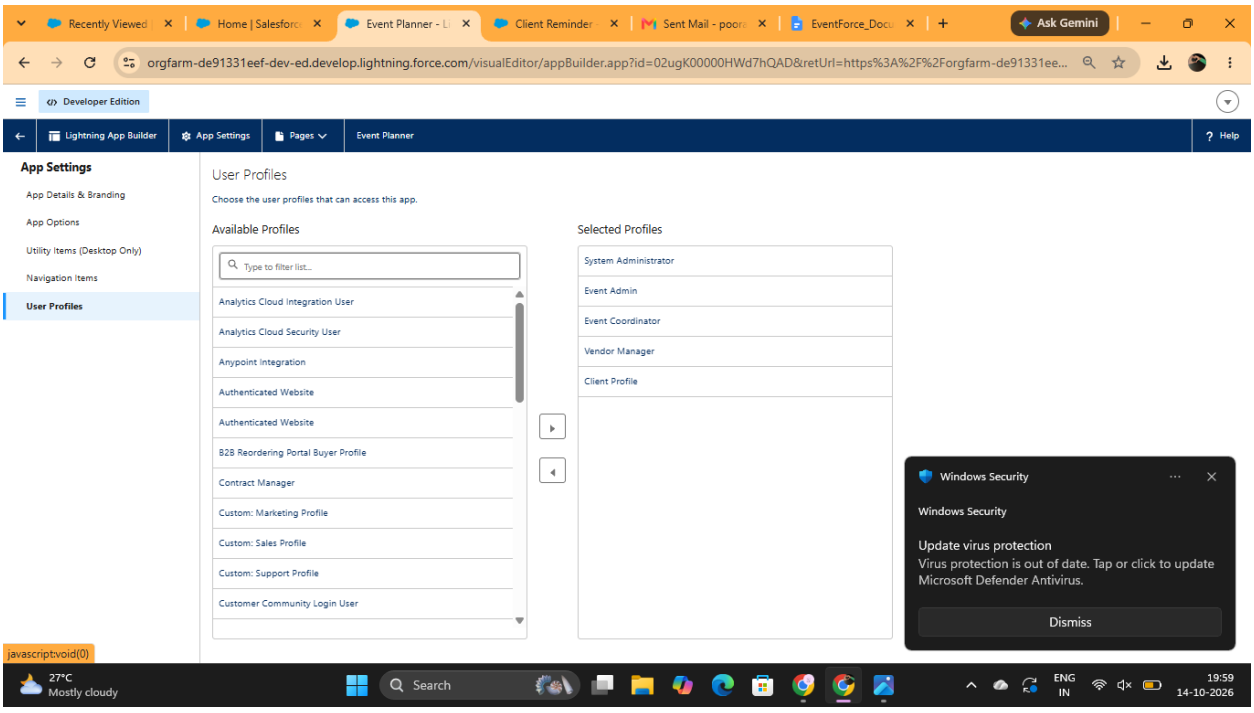

A custom Lightning application was configured to provide a unified interface for managing events, clients, vendors, venues, feedback, reports, and dashboards. The application improves navigation and access to the system's main modules.

Milestone 12: Reports

A report named Upcoming Events by Month was configured to summarize upcoming events by calendar month. The report supports event tracking and provides a view of event schedules and related information.

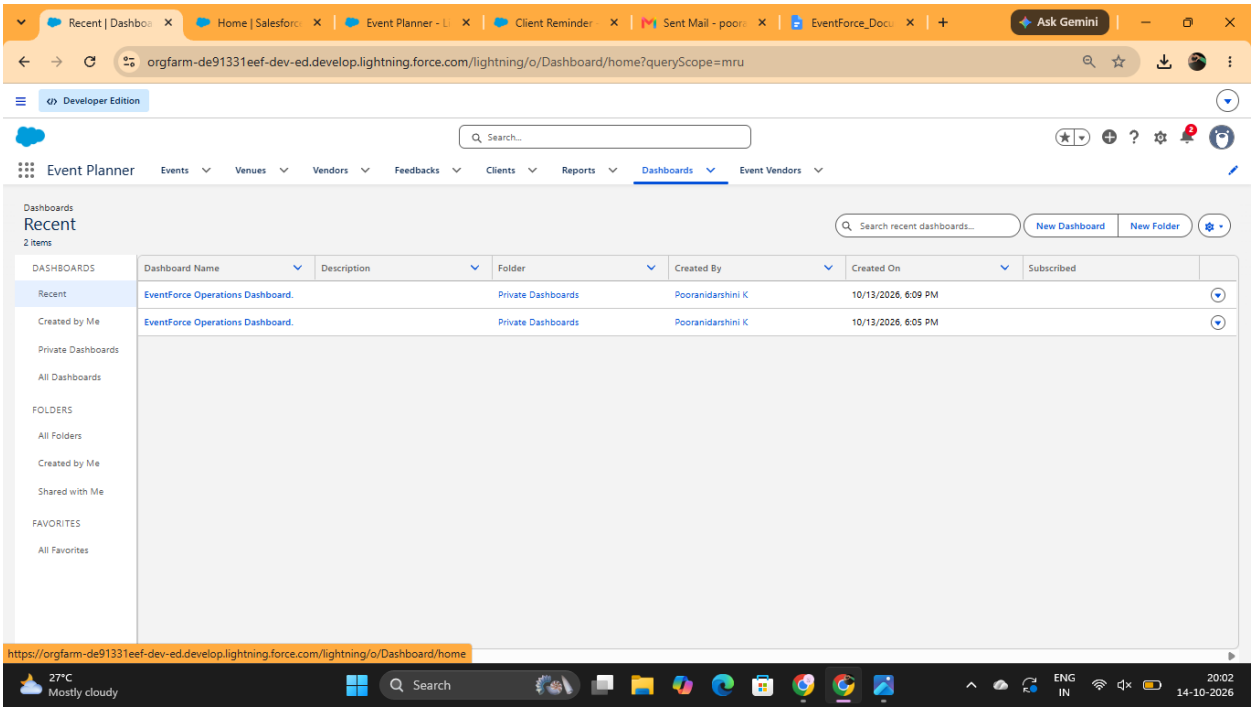

Upcoming Events by Month Report.

Milestone 13: Dashboard Development

An operations dashboard was created to display event-related information visually. It uses report components to help users monitor upcoming events and understand event schedules.

EventForce Operations Dashboard.

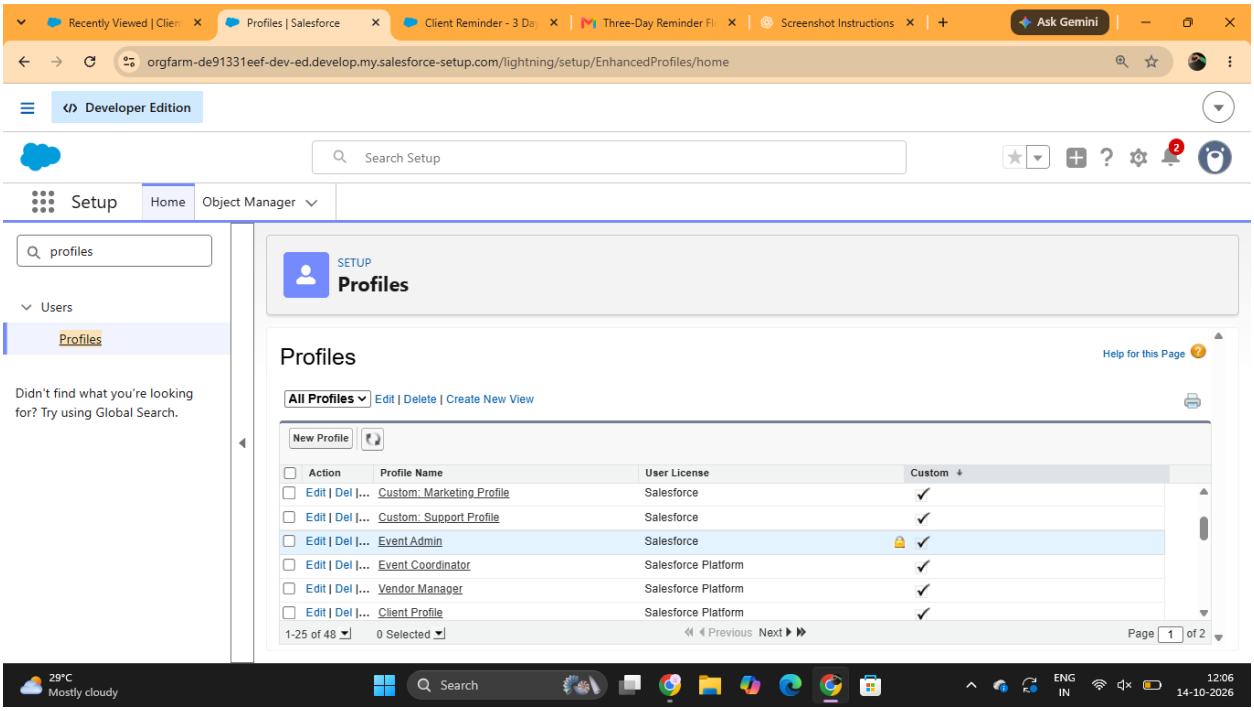

Phase 4 – Data Migration, Testing & Security

Milestone 14: Profiles

Profiles were configured to control user permissions within Salesforce. They define the objects and functions that users can access based on their responsibilities.

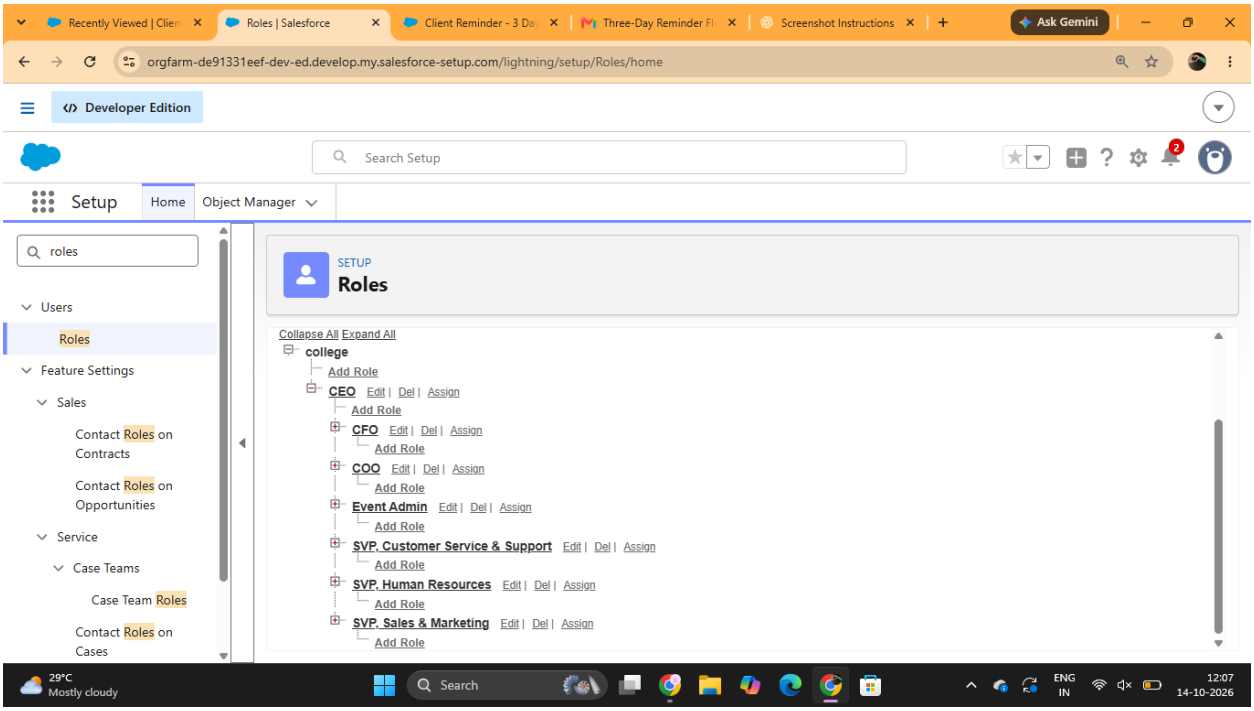

Salesforce Profile Configuration.

Milestone 15: Role Hierarchy

A role hierarchy was configured to represent the responsibilities of different users in the EventForce system. It supports record visibility according to the configured Salesforce sharing model.

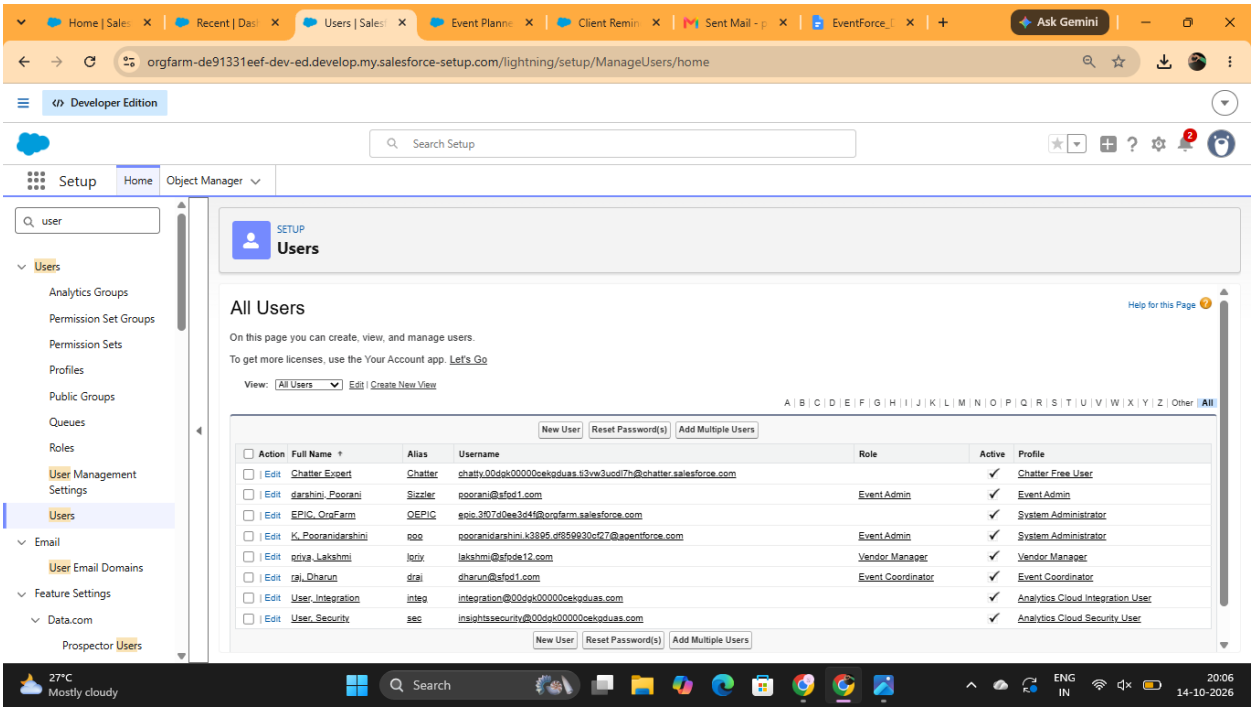

Salesforce Role Hierarchy.

Milestone 16: User Configuration

Salesforce users were configured with appropriate profiles and roles to represent the different responsibilities involved in event management. This configuration supports role-based access and system administration.

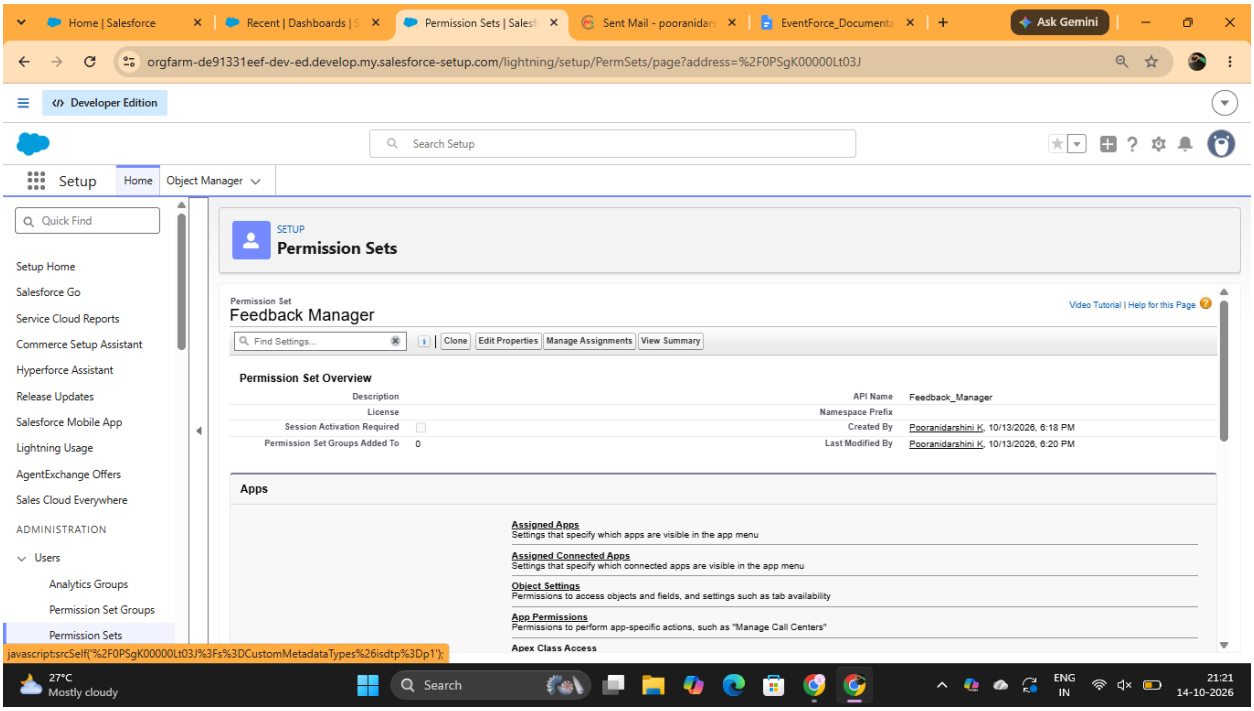

Salesforce Users and Assigned Access.

Milestone 17: Permission Sets

Permission sets were configured to grant additional access to selected users without changing their assigned profiles. They provide a flexible method for managing specific permissions.

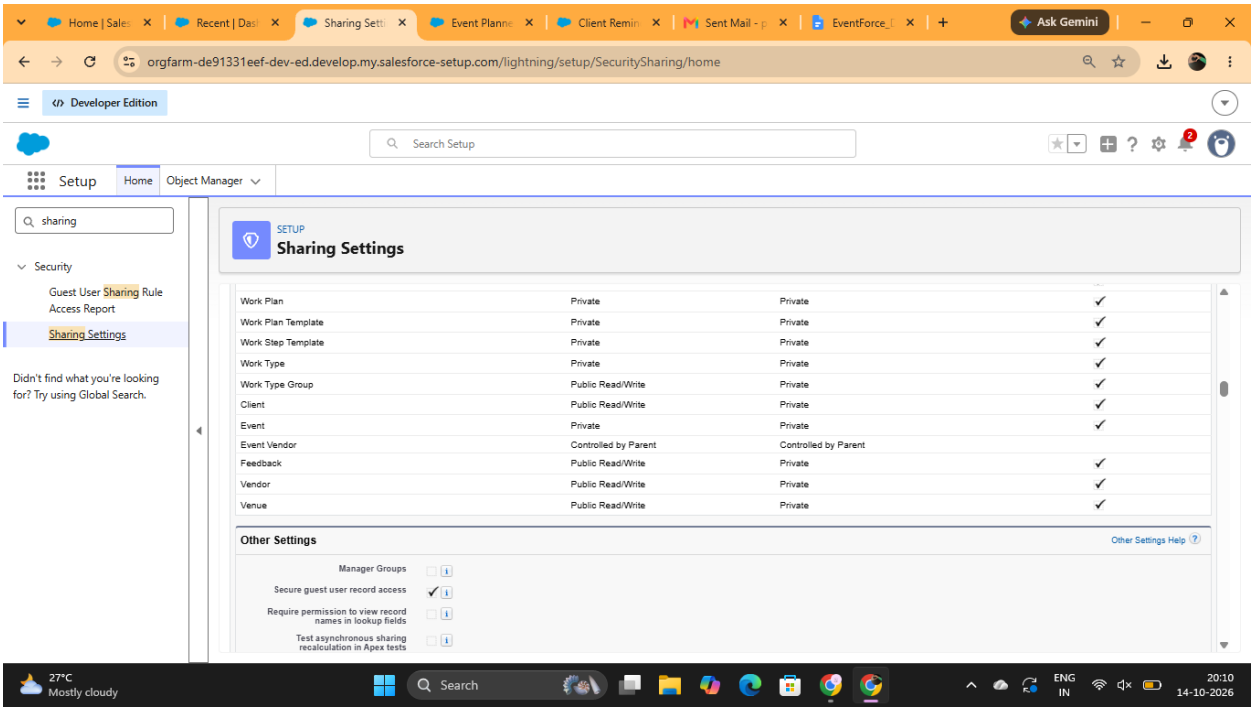

Permission Set Configuration.

Milestone 18 – Sharing Settings

Organization-Wide Defaults were configured to establish the baseline record access for Events. A sharing rule named Event_Sharing_For_Vendors was configured to grant read-only access to eligible Event records owned by Event Coordinators to the Vendor Manager role.

Salesforce Sharing Settings and Event Sharing Rule.

Phase 5 – Deployment, Documentation & Maintenance

Deployment Strategy

The EventForce Management System was developed and tested in a Salesforce Developer Edition environment. This phase focuses on preparing the configured components for future deployment.

The project includes custom objects, fields, relationships, validation rules, approval processes, Flows, Apex classes, triggers, reports, and dashboards.

Actual production deployment was not performed as part of this project. In a real-world environment, Salesforce DX, Change Sets, or CI/CD pipelines can be used to migrate the components from a development environment to a production environment.

The project components can be maintained in version control to support future updates and deployment.

Maintenance, Monitoring & Troubleshooting

Maintenance helps ensure that event, client, vendor, venue, and feedback data remain accurate and up to date.

The following activities are important for maintaining the EventForce Management System:

- Monitor Flows, Apex jobs, and approval processes for failures.
- Resolve user access errors and permission conflicts.
- Debug Apex triggers and Flow logic when unexpected errors occur.
- Review validation rules and sharing settings when business requirements change.
- Verify that reports and dashboards display the expected information.

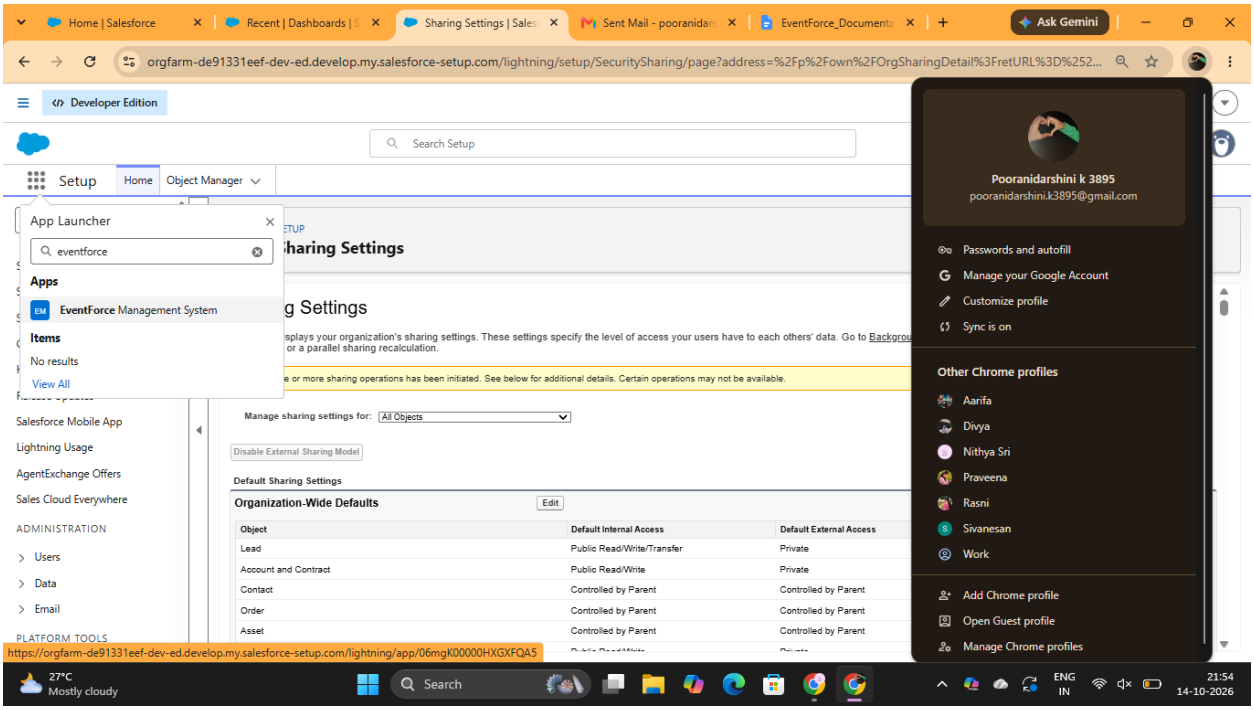

These activities help improve system reliability, security, and long-term maintainability.

Project Documentation

The project documentation provides a structured record of the EventForce Management System and its implementation.

It includes the project overview, objectives, data model, custom objects, fields, relationships, automation components, security configurations, reports, dashboards, and testing results.

Screenshots are included to demonstrate the important configurations and implemented features. This documentation can help future developers and administrators understand, maintain, and extend the system.

Conclusion

The EventForce Management System demonstrates how Salesforce can be customized to support and automate event-planning operations.

The project uses custom objects and relationships to organize event, client, vendor, venue, and feedback information. Validation rules help maintain data accuracy, while approval processes, Flows, Apex classes, and triggers support automation of important business operations.

The Lightning application provides a centralized interface for managing records. Reports and dashboards help users monitor event information, while profiles, roles, permission sets, and sharing rules support controlled access to data.

Through this project, practical knowledge was gained in Salesforce administration, data modeling, automation, Apex development, security configuration, reporting, testing, and project documentation.

The project was implemented in a Salesforce Developer Edition environment for academic purposes. It provides a foundation for future improvements and potential production deployment.

Overall, the EventForce Management System demonstrates the application of Salesforce CRM features to improve event management, data organization, and operational efficiency.
